Project Phase 0 :- Proposal

Name of the app :- Currency Converter

Team members :- Rajveer Kaur and Amandeep Kaur

Description :-

I and my teammate have decided to make a currency converter app. In this app, first there will be a sign-in page, here user have to enter the username or e-mail address with a password to sign-in to account and to go to home page. If the user does not have any account yet, then there will be a link just bottom to the sign-in button to create an account. New users have to enter the required information on the sign-up page to get an account and to move to the home page. On the home page, there will be a hamburger dropdown menu and an image related to our currency converter app. From the hamburger dropdown menu, user can move further to the converter page where user can see the currency conversion rate of desired countries. On the converter page, there will be two dropdown menus for countries, user have to select the countries then there will be text boxes under each dropdown menu where when user will enter any amount in one textbox then conversion will be shown to the other

text box according to that amount. For example: - If user want to see the currency conversion of 1 Canadian dollar to Indian rupees then user have to select Canada in first dropdown menu then India in another one. After that enter the Canadian dollar like 10 then in another text box the conversion will be shown which will be 572.08. There will be two more options on converter page, first, return to home page option will help user to go back to home page and the sign out option will help to go back to sign in page

Wireframe of our app :-
